

# Transmission Network Asset Mapping and Predictive Utility GIS System

## Project Description

A regional power distribution utility invites proposals for implementation of a geospatial asset management and predictive maintenance system for transmission and distribution infrastructure. The project aims to create a centralized GIS-based utility network model integrating substations, transformers, transmission lines, smart meters, and outage management systems.

## Budget Range

\$250,000 - \$450,000

## Project Timeline

Start Date: 2026-07-01  
End Date: 2027-04-15

## Technical Requirements

- Utility network GIS modeling
- SCADA and IoT telemetry integration
- Drone imagery processing
- GPS-enabled field asset collection
- Critical infrastructure cybersecurity

## Deliverables

- Validated utility asset inventory
- Transmission network GIS model
- Mobile inspection application
- Predictive maintenance dashboard
- Operations training manuals

## Evaluation Criteria

| Criterion              | Weight |
|------------------------|--------|
| Utility GIS Experience | 30%    |

|                         |     |
|-------------------------|-----|
| Technical Architecture  | 25% |
| Integration Methodology | 15% |
| Timeline & Resources    | 10% |
| Commercial Proposal     | 10% |
| Support & Training      | 10% |
